**Keywords:** Large Language Models, AI-Detection, Maximum Likelihood Estimate  
**TL;DR:** This paper enhances the Distributional Large Language Model (LLM) Quantification Framework by incorporating advanced tokenization and parts-of-speech techniques to more accurately differentiate between AI-generated and human-generated text.

**Abstract:**  
We propose an enhancement to the Framework originally introduced by Liang (2024). By incorporating different phrase lengths and parts of speech, our improved model more accurately differentiates between AI-generated and human-generated text at the corpus level. Testing on Liang's original validation datasets revealed three models that outperform the baseline error rate of 1.97%: a 1-word model focusing on adjectives (1.63%), a 2-word model focusing on adverbs (1.42%), and a 1-word model focusing on verbs (0.47%). These enhancements highlight LLMs' biases towards specific tokens and provide a more reliable method for distinguishing AI-generated content from human-generated content.

### Paper Decision

Decision Program Chairs 17 Jun 2024, 12:06 (modified: 18 Jun 2024, 00:09) Program Chairs, Authors Revisions (/revisions?id=SFAQjbLeAE)

**Decision:** Accept

### Meta Review of Submission69 by Area Chair

## A5Xp

Meta Review  Area Chair A5Xp  16 Jun 2024, 20:17 (modified: 18 Jun 2024, 00:09)

 Area Chairs, Authors, Program Chairs  Revisions (/revisions?id=EA2s4VDclC)

### Metareview:

The reviewers agree that this work on identification of generated text is relevant to the topics of the workshop. I agree with this assessment, and recommend acceptance. Nevertheless, I would recommend the authors expand on the technical details of their experiments, as suggested by the reviewers.

**Recommend For Journal:** No

**Recommendation:** Accept (Poster)

**Recommend For Ai For Good:** No

**Confidence:** 3: The area chair is somewhat confident

## This paper proposes an enhancement to the Distributional Large Language Model (LLM) Quantification Framework by incorporating different phrase lengths and parts of speech.

**Recommend For Journal:** Yes

### Review:

Pros:

1. The topic of detecting AI-generated data is important.
2. Author find that incorporating different phrase lengths and parts of speech could more accurately detecting AI generated-data.

Cons:

1. Novelty is limited, and this may seem like a single experiment to explore the effects of phrase lengths and parts of speech.
2. Descriptions are vague, such as which model the AI-generated text was generated, experimental Settings, and so on.

**Recommend For Ai For Good:** Yes

**Rating:** 3: Clear rejection

**Confidence:** 3: The reviewer is fairly confident that the evaluation is correct

## The AI Disguise: Applying Advanced Tokenization and POS Techniques for Text Authenticity

Official Review  Reviewer hkoL  12 Jun 2024, 23:10 (modified: 18 Jun 2024, 00:08)

 Program Chairs, Area Chairs, Reviewer hkoL, Authors  Revisions (/revisions?id=BTRbktqpHT)

**Recommend For Journal:** Yes

### Review:

This paper focuses on developing new techniques to differentiate AI-generated text from human-generated text. It proposes an enhancement to a previous method and conducts extensive experiments. Unlike traditional models, their approach operates on 2 or 3-word tokens and uses POS tagging to create different versions of the source dataset. By

tagging parts of speech and processing them independently, they demonstrate a reduction in test error percentage. Their simple yet elegant method is effective.

Overall, the paper is easy to understand, relevant to the conference goals, and presents work of practical significance.

**Recommend For Ai For Good:** Yes

**Rating:** 7: Good paper, accept

**Confidence:** 4: The reviewer is confident but not absolutely certain that the evaluation is correct
